

std::exception

```
classDiagram
    class std_exception["std::exception"]
    class registry_sqlite3_init_db_failed["registry::SQLite3InitDbFailed"]
    registry_sqlite3_init_db_failed --|> std_exception
```

The diagram illustrates an inheritance relationship. At the top is a class box for 'std::exception', which is divided into three horizontal sections: the top section contains the class name, and the two bottom sections are empty. Below it is a class box for 'registry::SQLite3InitDbFailed', also divided into three horizontal sections: the top section contains the class name, and the two bottom sections are shaded gray. A blue arrow with an open triangular head points from the top section of the 'registry::SQLite3InitDbFailed' box to the bottom section of the 'std::exception' box, indicating that 'registry::SQLite3InitDbFailed' inherits from 'std::exception'.

registry::SQLite3InitDbFailed
